

## **04 - Iteration Control Structures**

**For example:**

<b>Input</b>	<b>Result</b>
20	1 2 4 5 10 20

**Ex. No. : 4.1**

**Date:**

**Register No.:**

**Name:**

---

## **Factors of a number**

Determine the factors of a number (i.e., all positive integer values that evenly divide into a number)

```
number = 20
```

```
factors = []
```

```
for i in range(1, int(number**0.5) + 1):
```

```
    if number % i == 0:
```

```
        factors.append(i)
```

```
    if i != number // i:
```

```
        factors.append(number // i)
```

```
factors.sort()
```

```
print(factors)
```

**For example:**

<b>Input</b>	<b>Result</b>
292	1
1015	2
108	3
22	0

Ex. No. : 4.2

Date:

Register No.:

Name:

---

## Non Repeated Digit Count

Write a program to find the count of non-repeated digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ .

Some examples are as below.

If the given number is 292, the program should return 1 because there is only 1 non-repeated digit '9' in this number

If the given number is 1015, the program should return 2 because there are 2 non-repeated digits in this number, '0', and '5'.

If the given number is 108, the program should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO non-repeated digits in this number.

```
n = input().strip()
dcnt = {}
for d in n:
    if d in dcnt:
        dcnt[d] += 1
    else:
        dcnt[d] = 1
nrcnt = 0
for d in dcnt:
    if dcnt[d] == 1:
        nrcnt += 1

print(nrcnt)
```

Example1: if the given number N is 7, the method must return 2

Example2: if the given number N is 10, the method must return 1

**For example:**

Input	Result
7	2
10	1

Ex. No. : 4.3

Date:

Register No.:

Name:

---

## Prime Checking

Write a program that finds whether the given number N is Prime or not. If the number is prime, the program should return 2 else it must return 1.

Assumption:  $2 \leq N \leq 5000$ , where N is the given number.

```
n = int(input().strip())  
is_prime = True  
if n <= 1:  
    is_prime = False  
else:  
    for i in range(2, int(n**0.5) + 1):  
        if n % i == 0:  
            is_prime = False  
            break  
  
if is_prime:  
    print(2)  
else:  
    print(1)
```

Input Format:

Integer input from stdin.

Output Format:

Perfect square greater than N.

Example Input:

10

Output:

16

Ex. No. : 4.4

Date:

Register No.:

Name:

---

## Next Perfect Square

Given a number N, find the next perfect square greater than N.

```
import math  
n = int(input().strip())  
ns = (math.isqrt(n) + 1) ** 2  
print(ns)
```

NOTE: Fibonacci series looks like –

0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, . . . and so on.

i.e. Fibonacci series starts with 0 and 1, and continues generating the next number as the sum of the previous two numbers.

- first Fibonacci number is 0,
- second Fibonacci number is 1,
- third Fibonacci number is 1,
- fourth Fibonacci number is 2,
- fifth Fibonacci number is 3,
- sixth Fibonacci number is 5,
- seventh Fibonacci number is 8, and so on.

**For example:**

**Input:**

7

**Output**

8

**Ex. No. : 4.5**

**Date:**

**Register No.:**

**Name:**

---

## **Nth Fibonacci**

Write a program to return the nth number in the fibonacci series. The value of N will be passed to the program as input.

```
n = int(input().strip())  
  
fibonacci = [0, 1]  
  
for i in range(2, n + 1):  
    fibonacci.append(fibonacci[i - 1] + fibonacci[i - 2])  
  
print(fibonacci[n])
```

Input Format:

Single Integer Input from stdin.

Output Format:

Yes or No.

Example Input:

175

Output:

Yes

Explanation

$$1^1 + 7^2 + 5^3 = 175$$

Example Input:

123

Output:

No

**For example:**

**InputResult**

175    Yes

123    No

Ex. No. : 4.6

Date:

Register No.:

Name:

---

## Disarium Number

A Number is said to be Disarium number when the sum of its digit raised to the power of their respective positions becomes equal to the number itself. Write a program to print number is Disarium or not.

```
n = input().strip()

def is_disarium(number):

    length = len(number)

    total = 0

    for i in range(length):

        total += int(number[i]) ** (i + 1)

    return total == int(number)

if is_disarium(n):

    print("Yes")

else:

    print("No")
```

## Sample Test Cases

### Test Case 1

Input

4

Output

1234

Explanation:

as input is 4, have to take 4 terms.

$1 + 11 + 111 + 1111$

### Test Case 2

Input

6

Output

123456

**For example:**

Input	Result
3	123

Ex. No. : 4.7

Date:

Register No.:

Name:

---

### Sum of Series

Write a program to find the sum of the series  $1 + 11 + 111 + 1111 + \dots + n$  terms (n will be given as input from the user and sum will be the output)

```
a=int(input())
```

```
t=1
```

```
s=0
```

```
for i in range(1,a+1):
```

```
    s=s+t
```

```
    t=t*10+1
```

```
print(s)
```

**For example:**

<b>Input</b>	<b>Result</b>
292	2
1015	3

**Ex. No.** : 4.8

**Date:**

**Register No.:**

**Name:**

---

## Unique Digit Count

Write a program to find the count of unique digits in a given number N. The number will be passed to the program as an input of type int.

Assumption: The input number will be a positive integer number  $\geq 1$  and  $\leq 25000$ .

For e.g.

If the given number is 292, the program should return 2 because there are only 2 unique digits '2' and '9' in this number

If the given number is 1015, the program should return 3 because there are 3 unique digits in this number, '1', '0', and '5'.

```
a=int(input())
```

```
c=0
```

```
n=[]
```

```
r=[]
```

```
while a>0:
```

```
    re=a%10
```

```
    n.append(re)
```

```
    a=a//10
```

```
l=len(n)
```

```
for i in range(l):
```

```
    if (n[i] not in r):
```

```
        r.append(n[i])
```

```
print(len(r))
```

Input Format:

Single Integer input.

Output Format:

Output displays Yes if condition satisfies else prints No.

Example Input:

14

Output:

Yes

Example Input:

13

Output:

No

Input Format:

Single integer input.

Output Format:

Yes or No.

Example Input:

24

Output:

Yes

Example Input:

26

Output:

No

**For example:**

Input	Result
24	Yes

**Ex. No. : 4.10**

**Date:**

**Register No.:**

**Name:**

---

### **Perfect Square After adding One**

Given an integer N, check whether N the given number can be made a perfect square after adding 1 to it.

```
n = int(input().strip())
if (n + 1) ** 0.5 % 1 == 0:
    print("Yes")
else:
    print("No")
```
